

Pokemon Skill Tracking Report

Generated 2026-05-14 from docs/pokemon_mastery/measurement_progress_ledger.csv. This report uses local measurement artifacts only; it does not claim ladder Elo, mastery, or boss-sim validation.

Current Scoreboard

LEDGER ROWS 162 excluding CSV header	FRESH DECISIONS 2125 replay + focused transfer	FRESH TOP-MATCH 40.6% 863/2125	FRESH ACCEPTABLE 59.2% 1257/2125
---	---	---	---

Best hard fact

Fresh replay work has produced 2125 scored side decisions across 97 replay/transfer rows. The aggregate is 40.6% top-match and 59.2% acceptable-match.

Important limitation

Constructed probes are perfect on paper (265/265), but they are regression checks. The honest skill signal is the lower, noisier fresh replay score.

Fresh Replay Trend

Cumulative agreement across fresh replay/transfer rows

Rolling 10-row agreement across fresh replay/transfer rows

Evidence Split

Replay turn-pause	Top		709/1693 (41.9%)
	Acceptable		1026/1693 (60.6%)
Focused transfers	Top		154/432 (35.6%)
	Acceptable		231/432 (53.5%)
Constructed probes	Top		265/265 (100.0%)
	Acceptable		265/265 (100.0%)

Focused transfers are expected to score lower because they target known failure classes. Constructed probes are expected to score high because they are nonblind policy regressions.

Error Control

Error counts: first 20 vs latest 20 fresh replay/transfer rows

WINDOW	DECISIONS	TOP	ACCEPTABLE	SEVERE	MECHANICS	STATE	HIDDEN INFO
First 20 fresh rows	405	146/405 (36.0%)	233/405 (57.5%)	5	0	2	0
Latest 20 fresh rows	544	202/544 (37.1%)	304/544 (55.9%)	1	1	3	4
All fresh rows	2125	863/2125 (40.6%)	1257/2125 (59.2%)	10	1	8	4

Data Inventory

TEST TYPE	ROWS	SCENARIO COUNT	TOP AGREEMENT	ACCEPTABLE AGREEMENT	SEVERE	MECH	STATE	HIDDEN

counter_handoff_loop_transfer_001	40	30.0%	40.0%	0	1	0
setup_hidden_role_stop_transfer_001	39	41.0%	64.1%	0	0	0

Most recent fresh transfer

setup_hidden_role_stop_transfer_001_2026_05_14: 16/39 top-match, 25/39 acceptable-match, 0 severe blunders, 0 mechanics errors, 0 state errors, 0 hidden-info errors.

Most recent constructed probe

screen_phaze_third_owner_probe_001_2026_05_14: 4/4_action_policy_hits and 4/4_boundary_hits. This confirms the correction is written down, not that it transfers under pressure.

What The Measurement Says

The clearest improvement is error control. The first 20 fresh rows had 5 severe blunders; the latest 20 fresh rows have 1. That is a real positive signal.

The move-choice signal is mixed. Top-match is slightly higher in the latest 20 fresh rows (37.1%) than the first 20 (36.0%), but acceptable-match is lower (55.9% vs 57.5%). This means the study is not yet stable enough to claim a broad skill jump.

The current bottleneck is transfer: can the clean policy-card corrections survive fresh replay turns without labels or hints? The next measurement step should therefore be a fresh transfer, not another broad note pass.
